94/11/10 (四)

1. (Trappe 2<sup>nd</sup> Ed. 3.13.3)
  - (a) Find all solutions of  $12x \equiv 28 \pmod{236}$
  - (b) Find all solutions of  $12x \equiv 30 \pmod{236}$
  
2. (Trappe 2<sup>nd</sup> Ed. 3.13.6)
  - (a) Let  $F_1 = 1, F_2 = 1, F_{n+1} = F_n + F_{n-1}$  define the Fibonacci numbers 1,1,2,3,5,8,... Use the Euclidean algorithm to compute  $\gcd(F_n, F_{n-1})$  for all  $n \geq 1$
  - (b) Find  $\gcd(11111111, 11111)$
  - (c) Let  $a = 111\dots11$  be formed with  $F_n$  repeated 1's and let  $b = 111\dots11$  be formed with  $F_{n-1}$  repeated 1's. Find  $\gcd(a, b)$ . (Hint: Compare your computations in parts (a) and (b))
  
3. (Trappe 2<sup>nd</sup> Ed. 3.13.15)
  - (a) Compute  $\phi(d)$  for all of the divisors of 10 (namely, 1, 2, 5, 10), and find the sum of these  $\phi(d)$ .
  - (b) Repeat part (a) for all of the divisors of 12
  - (c) Let  $n \geq 1$ . Conjecture the value of  $\sum \phi(d)$ , where the sum is over the divisors of  $n$ . (This result is proved in many elementary number theory texts.)
  
4. (Trappe 2<sup>nd</sup> Ed. 3.13.19) Find all primes  $p$  for which  $\begin{pmatrix} 3 & 5 \\ 7 & 3 \end{pmatrix} \pmod{p}$  is not invertible.
  
5. (Trappe 2<sup>nd</sup> Ed. 3.13.22)

We want to find an exponent  $k$  such that  $3^k \equiv 2 \pmod{65537}$

  - (a) Observe that  $2^{32} \equiv 1 \pmod{65537}$ , but  $2^{16} \not\equiv 1 \pmod{65537}$ . It can be shown (Exercise 32) that 3 is a primitive root mod 65537, which implies that  $3^n \equiv 1 \pmod{65537}$  if and only if  $65536 \mid n$ . Use this to show that  $2048 \mid k$  but 4096 does not divide  $k$ . (Hint: Raise both sides of  $3^k \equiv 2 \pmod{65537}$  to the 16-th and to the 32-nd powers.)
  - (b) Use the result of part (a) to conclude that there are only 16 possible choices for  $k$  that need to be considered. Use this information to determine  $k$ .  
This problem shows that if  $p-1$  has a special structure, for example, a power

of 2, then this can be used to avoid exhaustive searches. Therefore, such primes are cryptographically weak. See Exercise 9 in Chapter 7 for reinterpretation of the present problem.

6. (Trappe 2<sup>nd</sup> Ed. 3.13.29)

Use the Legendre symbol to determine which of the following congruences have solutions (each modulus is prime)

(a)  $X^2 \equiv 123 \pmod{401}$

(b)  $X^2 \equiv 43 \pmod{179}$

(c)  $X^2 \equiv 1093 \pmod{65537}$

7. (Trappe 2<sup>nd</sup> Ed. 3.13.40)

(a) Give an example of integers  $m \neq n$  with  $\gcd(m,n) > 1$  and integers  $a, b$  such that the simultaneous congruences

$$x \equiv a \pmod{m}$$

$$x \equiv b \pmod{n}$$

have no solution.

(b) Give an example of integers  $m \neq n$  with  $\gcd(m,n) > 1$  and integers  $a \neq b$  such that the simultaneous congruences

$$x \equiv a \pmod{m}$$

$$x \equiv b \pmod{n}$$

have a solution
